This is an example of an HD video taken with my Canon SX1 IS digital camera.

The camera records in MOV format at 5MB/sec. I edited the video using Vegas Movie Studio Platinum and saved it as an MPG file. My slideshow software was used to convert to the Flash and PX versions here.

This 4-minute video is a 51MB flash file. It will take a moment to begin playing depending on your connection speed.

To see the high-resolution or full-screen HD version requires a plugin called Photodex Presenter (pxplay). You may need to select "Manual Install".

```
PresenterObject("ProShow","objectname","/video/Hammock.px",720,405,true);
```

You can play full screen with right mouse-click. Very cool. All popular browsers are supported, but you need to be using a Windows computer.

This 4-minute video is a 306MB file. It will take a moment to begin playing depending on your connection speed.

HD is sort of excessive when viewing on the Internet. But it really is stunning on an HD TV. Amazing that this quality can be achieved with a small digital camera.
